Multidimensional Filtering, downsampling, and upsampling are the main parts of multidimensional multirate systems and filter banks. A complete filter bank consists of the analysis and synthesis sides. The analysis filter bank divides an input signal to different subbands with different frequency spectra.

Multirate filter banks use different sampling rates in different channels, matched to different filter bandwidths. Multirate filter banks are very important in audio work because the filtering by the inner ear is similarly a variable resolution 'filter bank' using wider pass-bands at higher frequencies.

There are many applications where the signal of a given sampling rate needs to be converted into an equivalent signal with a different sampling rate. Such systems are called multirate systems. This paper presents the fundamentals of multirate building blocks and filter banks and describes some applications of multirate systems.
